PART II

1.

a) Spell and Accio repectively

b) Accio

Summoning Charm Accio

No description

Confundus Charm Confundo

Causes the victim to become confused and befuddled.

c) The get_description method in the Confundo class, which would return the string 'Causes the victim to become confused and befuddled.' This is because the Confundo class overwrites the get_description method of its Spell parent class.

d) There can be two ways depending on how "description" is defined in the question is interpreted. If "description" means the name and incantation with the get_description() being called as a new line the following code is required to be added in the Accio class:

def get_description(self):

    return 'Causes the victim to become confused and befuddled.'

However, if "description" means simply the 'Causes the victim to become confused and befuddled.' text, then the following code should be added to the Accio class instead:

def __str__ (self):

    return 'Causes the victim to become confused and befuddled.'
